

1 TASKS 2.3: RAW AND TREATED EFFLUENT CHARACTERIZATION

1.1 FOCUS REPORT TASK DESCRIPTION

Submit data regarding the complete physical and chemical characterization of NPNS' raw wastewater (i.e. influent at Point A for the Project), to support the assessment of the appropriateness of the proposed treatment technology. The influent characterization results must be compared against the proposed treatment technology specifications.

1.2 EFFLUENT CHARACTERIZATION

1.2.1 General

The basic question that will be addressed in this document is:

- What are the expected list of contaminants that may be generated specifically by the new NPNS Effluent Treatment Facility (ETF)?

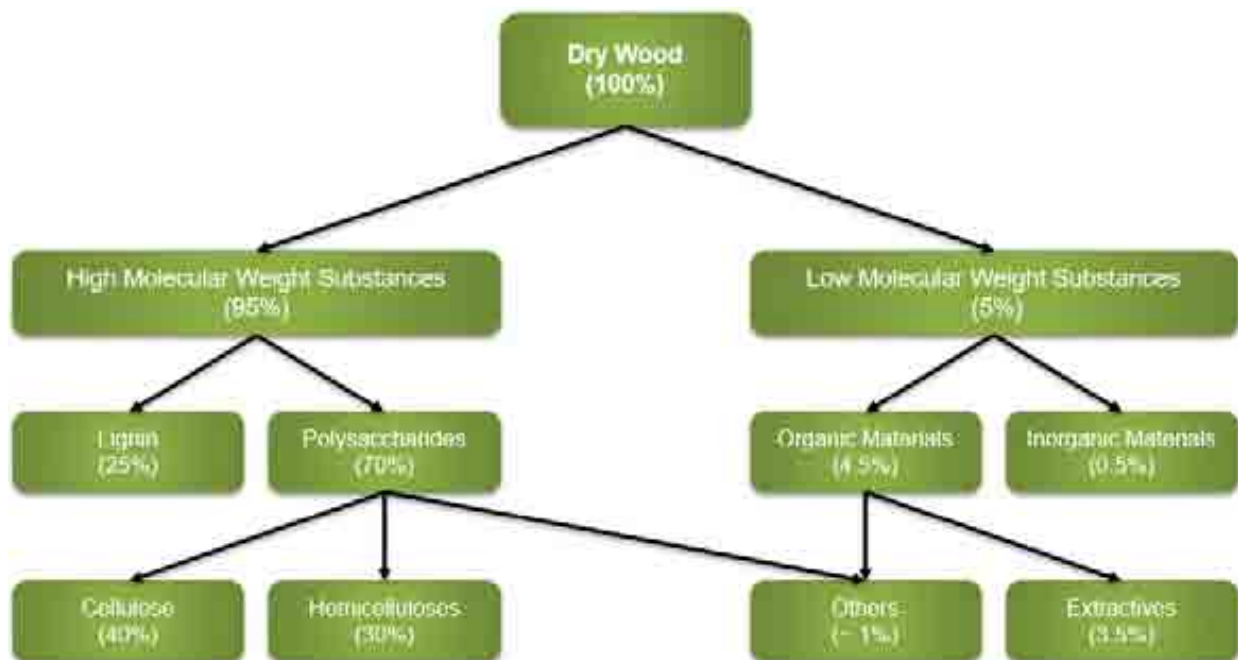

Effluents are a complex combination of compounds produced during the pulp and paper making process including wastewater from debarking, pulp washing, bleaching, regeneration of cooking chemicals and products from the breakdown of carbohydrates, lignin and extractives.

The composition and environmental impact of pulp and paper mill effluent has been a focus of scientific research for decades. There has been a significant amount of scientific data (see Section 1.5 for a full list of references used in this analysis) developed to better understand the composition and potential impact of pulp and paper mill effluents, especially in support of regulatory development efforts in the 1980's and 1990's. Most of the reported compounds are either non-chlorinated or have low degrees of chlorination and are expected to be readily biodegradable.

Wood is made up of cellulose fibres (fibre) bound together by lignin. The Kraft pulping process used at Northern Pulp utilizes chemicals to separate the fibres from the lignin. Wood chips are cooked in a solution of chemicals (referred to as cooking liquor) that dissolve the lignin from the wood chip leaving wood fibre. The lignin is then suspended in the spent chemical. The lignin and chemicals are then washed out of the cooked pulp solution so that they can be recovered and recycled for reuse. A portion of that wash water ends up as effluent that needs to be treated.

Effluent quality, or composition, reflects the nature of the raw water inputs, the furnish (fibres, fillers, etc.), the various processes used to break down the wood structure and the level and type of effluent treatment in place. The total wood mass of a living tree varies seasonally because of the moisture content, which can vary between 40% and 50% of the total wood mass. The chemical constituents of dry wood species can be categorized as structural substances and non-structural substances. Structural substances tend to be high-molecular weight (HMW) compounds such as cellulose, hemicelluloses and lignin. Non-structural substances are mostly low-molecular-weight (LMW) compounds such as extractives, some water-soluble organics, and inorganics. Figure 1-1, below, further expands on this categorization:

Figure 1-1: General Classification and Content of the Chemical Wood Components

The pulp fibres are naturally brown in color, the color of wood. The goal in bleaching chemical pulps is to remove essentially all of the residual lignin left after cooking, hence the process is often referred to as delignification. Chlorine was initially used to bleach the pulp in the 1970's and 1980's. Concerns about the release of organochlorine compounds into the environment prompted the development of Elemental Chlorine Free (ECF) and Totally Chlorine Free (TCF) bleaching processes in the 1990's. Chlorine dioxide (ClO_2) bleaching is referred to as ECF. NPNS converted to the ECF bleaching process in 1997. Chlorine dioxide (ECF technology) currently is the most common bleaching method worldwide. About 95% of all bleached Kraft pulp around the world is made using chlorine dioxide in ECF bleaching sequences. The bleaching, or delignification, of pulp at NPNS utilizes chlorine dioxide, sodium hydroxide, hydrogen peroxide and oxygen as the bleaching agents.

Advances in pulping technology, such as the replacement of chlorine with oxygen or chlorine dioxide, have considerably decreased the number of organic compounds and chlorinated compounds, as well as pollutant loads, that were found in pulp mill effluents 30 plus years ago.

In a bleached kraft pulp mill, the bleach plant effluent represents the majority of the pollutant load that must be treated in the secondary treatment system. These systems have been shown to biodegrade the resin and fatty acids, non-chlorinated and chlorinated phenolics and polyaromatic hydrocarbons to a level where the treated effluent is non-toxic and meets all regulated effluent discharge parameters (as discussed in Section 1.3).

1.2.2 Hardwood and Softwood Kraft Mill Effluents

The type of wood, hardwood versus softwood, that is used in the pulp production (ie. the furnish) affects the types of chemicals that are found in effluent. Typically, softwood pulp effluents have higher Chemical Oxygen Demand (COD) and colour content than those of hardwood pulp. The compounds responsible for colour are lignin fragments of high-molecular weight (HMW). In general, HMW compounds exhibit lower biodegradability than LMW compounds in the biological treatment process. Researchers have evaluated effluents from softwood and hardwood (eucalyptus) pulps by comparing typical effluent parameters such as AOX (Adsorbable Organic Halides), COD, BOD₅ (5-day Biochemical Oxygen Demand) and Colour of the different kinds of pulp production (conventional bleached pulps and oxygen delignified bleached pulps).

Traditionally, the separation between low molecular weight (LMW) and high molecular weight (HMW) is done at 1000 Daltons (grams/mole or g/mol, a unit of molecular mass). Bleached kraft mill effluents have an extended molecular weight distribution; from diverse LMW monomeric compounds to large and complex HMW molecules with molecular weights between 10,000 and 30,000 g/mol. The molecular weight distribution depends on the raw material and the bleaching process used. For example, the average molecular weight of organic matter in hardwood kraft pulp effluents is lower than the corresponding softwood effluents.

Research has shown that the HMW fraction contributed to approximately 40% of the total effluent load of COD both in softwood and hardwood ECF (elemental chlorine free) bleached pulps production (see Section 1.5). Additionally, the largest differences between softwood- and hardwood-derived effluents are in the aromatic region. The aromatic lignin-derived structures, such as syringyl and guaiacyl units, are not important structural elements in HMW effluent materials from ECF bleaching of oxygen delignified hardwood kraft pulps, but are important in softwood HMW effluents.

Similarly, research has shown that all HMW effluent fractions contained carbohydrates. The carbohydrates found in the HMW effluent materials were oligosaccharides, polysaccharides, or both, either in dissolved or colloidal form. As can be expected, the HMW hardwood kraft effluent fraction contained more carbohydrates (mainly xylan) than the corresponding samples from softwood kraft effluents. Significant levels of carboxylic acids, formed due to the oxidation of lignin structures in the bleaching process, also show up in the HMW effluent fractions.

The LMW compounds can be broadly classified into three main classes: acids, phenolic compounds and neutral compounds. The phenolic compounds and some of the acids are degradation products from lignin, while the resin acids, fatty acids, terpenes and sterols are residues of extractives present in the raw material (wood).

More than 50% of the wood used by Northern Pulp to make its products is mixed spruce (white, black and red), which are typically low in extractives (see Table 1.1) compared to other softwood species such as jack pine, balsam fir, larch and hemlock, also used at the mill. Some hardwoods, such as aspen, red maple, sugar maple and birch, are also present in the wood mix in some pulp grades, but typically consist of less than 20% of the total mix of the wood furnish.

Table 1-1 – Chemical Composition of Typical Wood Species Mix Furnish at Northern Pulp

Wood Species	Cellulose (%)	Hemicellulose (%)	Lignin (%)	Total Extractives (%)	Inorganic content (%)
Mixed Spruce	39.5	30.6	27.5	2.1	0.3
Balsam Fir <i>Abies balsamea</i>	38.8	29.2	29.1	2.7	0.2
Jack Pine <i>Pinus banksiana</i>	41.0	24.8	28.6	5.4	0.2
Maple <i>Acer rubrum /</i> <i>Acer saccharum</i>	41.3	30.2	25.3	2.9	0.3
Aspen <i>Populus tremuloides</i>	53.0	27.8	16.3	2.7	0.2
Birch <i>Beluta papyrifera</i>	39.4	36.1	21.6	2.6	0.3
Larch <i>Larix laricina</i>	43.0	22.7	28.5	5.6	0.2
Hemlock <i>Tsuga canadensis</i>	37.7	28.2	30.5	3.4	0.2
Typical Wood Furnish	40.5	29.7	26.7	2.7	0.26

1.2.3 Organochlorines

Adsorbable Organic Halides (AOX) is a term used to describe a large number of organic halogen compounds in the effluent. AOX is the sum parameter of Adsorbable Organic Chlorine (Cl), Iodine (I) and Bromine (Br). The term AOX covers a large group of organic constituents from simple volatile substances to more complex molecules, including dioxins and furans. The vast majority of AOX compounds are formed in the bleaching process particularly when chlorine is used. In effluents from bleached pulp mills, the halogen ("X") component of AOX is almost entirely chlorine. Mills that have switched to ECF using chlorine dioxide, like NPNS did in 1997, have significantly reduced the amount of AOX in their effluent.

Chlorinated organic compounds are synthesized and degraded in the environment by natural biological and chemical processes. This natural production varies, depending on the geographical location. Organisms have evolved in environments with background concentrations of natural chlorinated organic compounds. Many compounds identical, or similar to those formed during ECF bleaching of pulp, are produced by natural processes. There is evidence that these organisms possess mechanisms for effective breakdown of these types of chlorinated substances.

Because of this, chlorinated compounds formed during ECF pulp production technology will neither be recalcitrant with respect to breakdown in the environment nor resistant to biodegradation. Pulp mill AOX will ultimately be mineralized through photochemical and biological processes. During this mineralization, the chlorinated organic material will be released as chloride ions (Cl^-) and carbon dioxide (CO_2), as can be observed by the analytical results presented in Table 1-2, where chloride levels in the untreated effluent (Point A) are notably greater than the raw water figures.

Individual substances present in effluents from current pulping and pre-bleaching processes are investigated to a lesser extent since they are recycled during chemical recovery. Numerous studies have firmly established that concentrations of PCDDs, PDCFs and polychlorophenols in effluents from ECF bleaching are close to or below the level of detection (see Section 1.3.7). A large body of research, conducted after 1993, has concluded that substances identified in ECF bleaching are predicted to be readily biodegradable whereas less is known about the types of compounds in TCF bleaching effluent.

1.2.4 Physicochemical Properties of Pulping/ ClO_2 Bleaching By-Products

High molecular weight, hydrophobic, chlorinated organic compounds exhibit substantially different environmental behavior and toxicological modes of action than more hydrophilic chlorinated or non-chlorinated compounds. Lower molecular weight, more soluble substances exhibit little tendency to biomagnify, and have less potential for exerting insidious or food-web mediated toxic effects at the community and ecosystem level.

Minimization of highly bioaccumulative and persistent substances in final effluent will limit effects of long-term exposure to the effluent and shift the focus of concern to possible immediate or limited duration (acute) environmental effects for organisms directly exposed, followed secondarily by ecological consequences at higher levels of biological organization. It is clear that 100% ClO_2 substitution drastically reduces the production of higher chlorinated, more bioaccumulative phenolics (3 chlorine substituents) in final effluents. Few compounds in treated ECF mill effluents exhibit a $\log K_{ow} > 5.0$ (the threshold for substantial biomagnification potential)¹ or have the additional property of being relatively persistent in living organisms due to their resistance to metabolic modification.

¹ The n-octanol/water partition coefficient (**K_{ow}**) is used as a screening test for bio-accumulation test. The **log K_{ow}** value is a very important parameter for predicting the distribution of a substance in various environmental compartments (water, soil, air, biota, etc). Substances with high log K_{ow} values tend to adsorb more readily to organic matter in soils or sediments because of their low affinity for water. Chemicals with very high log K_{ow} values (i.e, **>5.0**) are of greater concern because they may have the potential to bio-concentrate in living organisms. The assumption behind this is that the uptake of an organic substance is driven by its hydrophobicity. For organic substances with a **log K_{ow}** value below 5,

Studies completed since 1993 suggest that some of the resin acids or naturally-occurring polycyclic aromatic hydrocarbons (PAHs) produced during the diagenesis of plant materials exhibit a similar environmental fate and effects as some of the compounds found in both ECF and TCF pulp mill effluents. Comparative research on the relative impact of TCF vs. ECF effluents is not readily available because of the very low volume of TCF pulps being produced (approximately 5% of the 38.0 million tonnes of pulp that was produced in 2018, according to the Confederation of European Paper Industries). The available data would indicate that both effluents, after treatment, show similar characteristics.

In general, the presently available studies on biodegradation and removal processes for constituents of pulp mill effluent emphasize the importance of effective secondary treatment in the reduction or elimination of whole effluent toxicity. Subsequent to past improvements in kraft mill effluent quality realized through ClO₂ substitution, future reductions in toxicant inputs where they are still occurring might be achieved through improvements in treatment, since (i) recent studies suggest that many bioactive compounds in final effluent are non-chlorinated compounds contributed by pulp mill processes other than bleaching, and (ii) most of the known deleterious substances in pulp mill effluent are amenable to biodegradation and/or removal through adsorption to particulates.

1.3 DATA ANALYSIS

To assess the content of the untreated and treated effluent at the mill, as well as to compare its characteristics to that of the receiving environment, samples sets of the following aqueous streams were taken on the following dates and a physical and chemical characterization performed:

- Raw water (Middle River) taken on April 24, 2018 and May 14, 2019;
- Untreated effluent (Point A) taken on May 29, 2018 and May 14, 2019;
- Treated effluent (Point C) taken on May 29, 2018, May 14, 2019 and July 17, 2019;

it is assumed that the affinity for the lipids of an organism is insufficient to exceed the bio-accumulation criterion.

- Caribou Harbour water taken on May 24 and May 25, 2019 averaging 6 samples to account for tide changes:
 - Flooding tide, Proposed Outfall Location, at the surface (0.5 m depth)
 - Flooding tide, Proposed Outfall Location, at the bottom (20 m depth);
 - Ebbing tide, Proposed Outfall Location, at the surface (0.5 m depth);
 - Ebbing tide, Proposed Outfall Location, at the bottom (21 m depth); and
 - Ebbing tide, in the Harbour, at the bottom (3 m depth).
 - Ebbing tide, in the Harbour, at the surface (0.5 m)

Production data, expressed in air dried metric tonnes (ADt), for the days when the effluent was sampled are as follows:

- Production rate:
 - May 29th, 2018: 853 ADt (948 ADUt²)
 - May 14th, 2019: 673 ADt (748 ADUt)
 - July 17th, 2019: 754 ADt (838 ADUt)
- Effluent Flow at Point C:
 - May 29th, 2018: 67,496 m³/day
 - May 14th, 2019: 62,800 m³/day
 - July 17th, 2019: 75,992 m³/day

A physical and chemical analysis was performed for a series of compounds typically found in pulp and paper mill effluents (as described earlier), which included the following categories:

- Inorganics and other parameters;
- Metals;
- Phenols;
- Fatty and resin acids;
- Polyaromatic hydrocarbons, volatile organics and PCB's;
- Petroleum hydrocarbons; and
- Dioxins and furans

The results of these analyses are presented in the sections that follow.

² Air dried unbleached metric tonnes, measured before the bleach plant.

1.3.1 Inorganics and Other Parameters

Table 1-2, below, shows the comparative results of the chemical analysis for various inorganic compounds, as well as compounds of interest from a regulatory and eutrophication context. The effluent sample tested includes analysis of both the liquid and solids portion of the samples. The Point A and Point C numbers highlighted below represent an average of test data from a full year of testing (2018). The highlighted parameters are collected and tested either daily or weekly by an accredited third party laboratory.

Table 1-2 – Analytical Results, Inorganics and Other Parameters

Inorganics	Units	Raw water	Point A	Point C	Caribou Harbour
Regulated parameters under the Pulp and Paper Effluent Regulations or addressed in the RWS					
Carbonaceous BOD	mg/l	ND	209	26	ND
Total Suspended Solids (TSS)	mg/l	4.4	365	29	2.5
Adsorbable Organic Halogen (AOX)	mg/l	0.05	1.2	1.02	NA
Colour	TCU	21	735	983	4.4
Total Nitrogen (N)	mg/l	0.489	3.2	4.7	0.15
pH	pH	7.23	7.7	7.6	7.7
Total Phosphorus (P)	mg/l	ND	1.4	1.5	ND
Total Chemical Oxygen Demand (COD)	mg/l	4.5	723	628	NA

The following results are based on the averages of the samples collected as described in section 1.3 above. Again all analyses were performed on the total sample that includes both the liquid and solid portions.

Inorganics	Units	Raw water	Point A	Point C	Caribou Harbour
Parameters where Point C results are greater than Caribou Harbour					
Total Alkalinity (Total as CaCO ₃)	mg/l	18.5	190	343	91
Turbidity	NTU	15	55	28	1
Volatile Suspended Solids	mg/l	ND	90	37	0.88
Total Kjeldahl Nitrogen (TKN)	mg/l	0.13	2.8	4.6	0.20
Nitrogen (Ammonia Nitrogen)	mg/l	ND	0.9	1.54	ND
Dissolved Organic Carbon (C)	mg/l	4.4	260	15	1.9
Total Organic Carbon (C)	mg/l	4.1	230	170	2.3
Orthophosphate (P)	mg/l	0.007	0.62	0.39	ND
Reactive Silica (SiO ₂)	mg/l	2.7	8.3	9.0	ND
Dissolved Chlorite (ClO ₂)	mg/l	ND	ND	1.1	ND
Sulphide	mg/l	ND	0.33	1.3	ND
Parameters where Point C results are lower than Caribou Harbour					
Conductivity	µS/cm	125	1,350	1,570	42,500
Salinity	PSU	ND	ND	ND	28
Dissolved Chloride (Cl ⁻)	mg/l	23	140	170	16,000
Dissolved Sulphate (SO ₄)	mg/l	7.7	280	270	1,930
Parameters where Point C results are the same as Caribou Harbour					
Nitrate + Nitrite (N)	mg/l	0.27	0.14	ND	ND
Nitrite (N)	mg/l	ND	0.035	ND	ND
Dissolved Chlorate (ClO ₃ ⁻)	mg/l	ND	103	ND	ND
Total Cyanide (CN)	mg/l	ND	ND	ND	ND

1.3.1.1 Regulated / RWS Parameters

The impact of regulated parameters, as well as those that have served as input to the Receiving Water Study were discussed in the original EARD. It is to be noted that there is, at this time, no valid analytical method for the measurement of adsorbable organic halogens (AOX) in sea water. As noted previously, AOX is not in itself a parameter that has any direct relevance to the environment. It has been created by the industry to represent the “catch all” or sum of all chlorinated compounds. In addition, the high COD number observed in sea water (3,808 mg/l, as tested) is believed to be the result of the high level of chlorides present in sea water. The chlorides can be oxidized during standard testing and result in heavy interference with the actual test results. Both test results were dismissed because of this and shown as “NA - not available” in Table 1-2.

1.3.1.2 Parameters where Point A or Point C results are greater than Caribou Harbour’s

The majority of the parameters in this “category” fall under categories that are addressed in the receiving water study (nutrients, colour and suspended solids). Three of the listed compounds are not in this category: dissolved chlorites, dissolved chlorate and reactive silica.

The end products of chlorine dioxide (ClO_2) reactions are chloride (Cl^-), chlorite (ClO^-) and chlorate (ClO_3^-) all of which were tested for in the effluent samples. Chloride is addressed in a subsequent section. Chlorite was measured in the Point C effluent, but was non-detect at Point A. Chlorite, a water-soluble ion, can combine with metal ions to form solid salts (e.g. sodium chlorite). Chlorine dioxide and sodium chlorite are effective sanitizing agents that are preferred over chlorine (Cl_2) as they do not react with organic matters in food or water to form harmful organohalogen by-products. Chlorine dioxide is approved as a disinfectant for potable water (US EPA (2000) 40 CFR, Part 141.64) and the US FDA has approved its use in poultry processing (US FDA (1995) 60 CFR, Part 173) and the sanitization of fruits and vegetables (US FDA (1998) 21 CFR, Part 173.300).

Chlorite, as well as chlorate ions have been shown to undergo reduction by bacteria under anaerobic conditions to form chloride ions that are naturally present in the ocean. Anaerobic degradation is an important process in anoxic groundwater, sediments, and some soils. It has been known for over 40 years that chlorate ions can be reduced by mixed cultures under anaerobic conditions. Chlorate-respiring bacteria are widely distributed in the environment and utilize electron acceptors (e.g., chlorate ions) in lieu of oxygen to generate energy and produce carbon-based building blocks. The reduction of chlorate ions occurs in two steps; chlorate reduction with chlorate reductase enzyme followed by chlorite disproportionation catalyzed by chlorite dismutase (a non-respiratory enzyme). Oxygen and chloride are formed as the end products.

Chlorate was measured in the Point A effluent, but was non-detect at Point C after biological treatment. Through anaerobic degradation, as noted above, chlorate is effectively converted to chlorite or chloride in the anoxic zones which precede aerobic effluent treatments. It is therefore expected, and in line with the testing results, that chlorate measured at Point A was reduced to chloride through the treatment process.

The presence of reactive silica is a result of the use of organic material (wood) in the pulping process. Silica, or silicon dioxide (SiO_2), or silicate minerals are the forms in which the earth's silicon is most likely to be encountered: these are combinations of the elements silicon and oxygen, in different balances. Ninety percent of the earth's crust is comprised of these compounds. Commonly-known examples are quartz, agate, onyx, jasper, vermiculite, talc and feldspar.

Silica is naturally present in all plants: It is what plant biologists call a “non-essential beneficial plant nutrient,” meaning that you don't need to apply it to your crops like nitrogen, phosphorus, and potassium (NPK fertilizers), but doing so can provide many benefits for both monocots (grasses, onions) and dicots (leafy greens, legumes). Plant decomposition would explain the presence of reactive silica in the raw water, while the higher levels of silica in the treated and untreated effluent can be explained by the higher concentration of plant material (wood) in the mill's process.

In the chemical recovery process present in kraft pulping, silica is considered a “non-process element”, and is usually purged to avoid excessive fouling and plugging in the evaporators and the recovery boiler. This is typically done by the purging of fly ash from the recovery boiler's electrostatic precipitator and bottom ash from the bark boiler. Since the bark boiler uses a wet ash handling system, some of the silica present in the ash will be present in the ash pond leachate and, ultimately, in the untreated effluent.

The increase of colour from Point A to Point C occurs at the BHETF across the primary sedimentation basin in the ASB process. The colour increases as a result of anaerobic activity of the primary sediments that build up in the sedimentation basin. This colour increase will not occur in the treated effluent once the new ETF is in operation, as no solids are left to accumulate in the AST system for any extended period of time.

1.3.1.3 Parameters where Point C results are lower than Caribou Harbour

The parameters tested at levels below Caribou Harbour levels are related to differences between sea water and streams that would be considered “fresh” water and, as such, are addressed by the results of the receiving water study.

The increase in chloride content from Point A to Point C is as expected as a result of the reduction of chlorine dioxide to dissolved chloride ions (Cl⁻). The natural concentration of chloride ion present in Caribou Harbour is 100 times greater than the chloride ion concentration of Point C effluent.

1.3.2 Metals

Table 1-3 below, shows the comparative results of the analysis of raw water, untreated effluent from Point A, treated effluent from Point C and water from Caribou Harbour for a full suite of metals.

Table 1-3: Analytical Results, Metals

Metals	Units	Raw water	Point A	Point C ³	Caribou Harbour
Metals measured in higher concentrations at Point C than at Caribou Harbour					
Total Arsenic (As)	µg/l	ND	0.6	1.1	ND
Total Cadmium (Cd)	µg/l	ND	1.40	1.03	ND*
Total Chromium (Cr)	µg/l	0.75	3.4	2.3	ND
Total Lead (Pb)	µg/l	ND	4.3	2.4	ND
Total Manganese (Mn)	µg/l	38	2,600	2,500	ND
Total Nickel (Ni)	µg/l	ND	3.3	3.2	ND
Total Aluminum (Al)	µg/l	405	2,150	1,673	ND
Total Barium (Ba)	µg/l	32	415	367	13
Total Cobalt (Co)	µg/l	ND	0.78	0.51	ND
Total Copper (Cu)	µg/l	3.8	11.5	5.8	ND
Total Iron (Fe)	µg/l	405	1,130	465	ND
Total Mercury (Hg)	µg/l	ND	ND	0.022	ND
Total Phosphorus (P)	µg/l	ND	1,165	1,425	ND
Total Silver (Ag)	µg/l	ND	0.41	0.25	ND
Total Titanium (Ti)	µg/l	7.3	44	12	ND
Total Vanadium (V)	µg/l	ND	3.2	3.6	ND
Total Zinc (Zn)	µg/l	ND	255	110	ND
* Cadmium of 0.12 µg/l was detected in one Caribou Harbour sample, all others were below the 0.1 µg/l detection limit.					

³ The metals analysis data for Point C, in addition to the samples collected for this report, were also taken from test data collected during annual testing done since 2015 and averaged.

Metals	Units	Raw water	Point A	Point C	Caribou Harbour
Metals measured in lower concentrations at Point C than at Caribou Harbour					
Total Boron (B)	µg/l	ND	58	70	3,630
Total Calcium (Ca)	µg/l	6,300	38,000	36,000	333,000
Total Magnesium (Mg)	µg/l	1,800	3,700	4,600	1,070,000
Total Potassium (K)	µg/l	760	11,500	18,000	320,000
Total Sodium (Na)	µg/l	15,500	225,000	340,000	8,700,000
Total Strontium (Sr)	µg/l	30	155	145	6,200
Total Uranium (U)	µg/l	ND	3.6	0.49	2.8
Metals detected at Point A but not detected at Point C or Caribou Harbour					
Total Thallium (Tl)	µg/l	ND	0.23	ND	ND

The following metals were not detected based on their individual detection limits (which are shown in italics) in any of the samples tested:

- Antimony (Sb) (*1 µg/l*);
- Beryllium (Be) (*1 µg/l*);
- Bismuth (Bi) (*2 µg/l*);
- Selenium (Se) (*1 µg/l*);
- Tin (Sn) (*2 µg/l*); and
- Molybdenum (Mo) (*2 µg/l*)

1.3.2.1 Metals measured in higher concentrations at Point C than at Caribou Harbour

The first set of metals that need to be analyzed are those shown in italics in Table 1-3, which are arsenic, cadmium, chromium, lead, manganese and nickel. These metals are naturally present in wood and have been identified by the US EPA as being the main components in particulate matter generated by biomass boilers⁴. It is therefore natural to observe them in pulp and paper mill effluents. Two other metals shown in italics in the non-detect list above, beryllium and selenium, are also part of this group but have not been detected in any of the samples tested. Some of these metals are also present, in lesser quantities, in the raw water used by the mill and are naturally occurring in the environment.

Other metals, such as cobalt, titanium, copper, zinc and aluminum are also likely coming from the pulping process as non-process elements in the wood itself. As described earlier, these non-process elements are regularly purged from the system, either via the effluent or solid waste, in order to protect the integrity of the equipment and the process. Except for aluminum, which is used as alum (aluminum sulphate) in the treatment of raw water from Middle River, none of these metals are components of additives used in the pulping process.

It is important to note that the effluent from municipal treatment systems also contain some of these heavy metals. The most commonly encountered heavy metals in municipal wastewater include cadmium, mercury, lead and arsenic.

Table 1-3 shows that a low concentration of mercury is detected in the final Point C effluent, but is non-detect in any of the samples of Point A untreated effluent. Elements such as mercury cannot be created through the secondary treatment process if they were not present in the incoming effluent. This means that its release to the environment is likely caused by an external factor, such as, potentially the treatment of the Boat Harbour Landfill leachate in the current ASB. Implementation of the new ETF should eliminate the presence of mercury from the final effluent. Confirmation, through future testing, will be needed to confirm that mercury is non-detect in future effluent.

⁴ <https://www.federalregister.gov/documents/2015/01/21/2014-29569/national-emission-standards-for-hazardous-air-pollutants-for-major-sources-industrial-commercial-and>

1.3.2.2 Metals measured in lower concentrations at Point C than at Caribou Harbour

The parameters tested at levels below Caribou Harbour levels are related to differences between sea water and streams that would be considered “fresh” water and, as such, are addressed by the results of the receiving water study.

1.3.3 Phenols

Table 1-4, below, shows the comparative results of the analysis of raw water, untreated effluent from Point A, treated effluent from Point C and water from Caribou Harbour for a full suite of phenols. All phenol results are based on 2019 data sets only.

Table 1-4: Analytical Results, Phenols

Phenols	Units	Raw water	Point A	Point C	Caribou Harbour
Total P&P Phenols	<i>µg/l</i>	ND	1400	6.13	ND ⁵

Phenols are the basic structural unit in a wide variety of synthetic organic compounds. Phenol and its higher homology are aromatic molecules containing hydroxyl group attached to the benzene ring structure. The origin of phenol in the environment is both industrial and natural. Phenol pollution has been associated with pulp and paper mills, coal mines, refineries, wood preservation, plants & various chemicals industries as well as their wastewaters. Due to their high inhibitory and antibacterial activity, high levels of phenols may create problems in the operation of biological treatment plants. They also add odour to drinking and food processing water and have mutagenic and carcinogenic effects. Phenol is also a priority pollutant and is included in the EPA list (1979).

There are typically two types of phenols encountered in pulp and paper mill effluents: wood-based phenols, which would originate from the unbleached side of the mill, and chlorinated phenols, which would be present in bleach plant effluents. Both are considered to be of intermediate molecular weight (from 100 to 1000 Daltons.), are moderately to highly soluble in water and are readily biodegradable, as can be seen when comparing the test results between Points A and C.

These compounds, for the most part, have low log Kow values (see Section 1.2.4) and are not likely to biomagnify or bioaccumulate. Their environmental half-life, when known, is measured in days to weeks, depending on the level of chlorination of the molecule.

When considering the products of ECF bleaching of pulp, it is important to recognize that many of the chlorinated substances produced in this process are also formed in nature. Several chlorophenolic isomers with biogenic origin have been isolated. Studies in Sweden have demonstrated that 2,4,6-trichlorophenol and its methylated analogue 2,4,6-trichloroanisole are ubiquitous in humus-rich waters and are formed by the action of microorganisms. Some degradation products from natural chlorinated lignin are similar to those occurring in bleached kraft mill effluents.

The US EPA, in its effluent standards for new facilities, has set specific limits on certain chlorophenols, mainly chloroform, trichlorosyringol, 3,4,5 & 6-trichlorocatechols, 3,4,5&6-trichloroguaiacols, 3,4,5&6 trichlorophenols, tetrachlorocatechol, tetrachloroguaiacol, 2,3,4,6-tetrachlorophenol and pentachlorophenol, all measured at the outlet of the bleach plant. None of these compounds have been detected in Northern Pulp's effluent, except for chloroform, which is shown in Table 1-8 to be fully biodegraded in the BHETF.

The Quebec government, in its Regulation respecting pulp and paper mills⁶, regulates the level of phenolic compounds that can be released to the environment from landfill leachates to 50 µg/l, in the premise that this level of phenolic compound discharge can readily be managed by natural means. This regulated level is far above the total level present in the treated effluent at Point C.

Catechol and guaiacol, as well as certain cresol and chorovanillin isomers, have been recognized in the literature as potentially having certain endocrine disrupting effects. Because of this, the following compounds should be further considered as compounds of potential concern (COPC) in treated effluent in future Human Health Risk Assessments:

- o-cresol (CAS #95-48-7);
- p-cresol (CAS #106-44-5);
- m-cresol(CAS #108-39-4);
- Guaiacol (CAS# 90-05-1);
- Catechol: (CAS# 120-80-9);
- 6-chlorovanillin (CAS #18268-76-3); and
- 5,6,dichlorovanillin (CAS #18268-69-4)

Pimaric acid	mg/l	ND	ND	0.08	ND
Sandaracopimaric acid	mg/l	ND	ND	0.035	ND
Resin acids not detected					
12,14-Dichlorodehydroabietic acid	mg/l	ND	ND	ND	ND
12-Chlorodehydroabietic acid	mg/l	ND	ND	ND	ND
14-Chlorodehydroabietic acid	mg/l	ND	ND	ND	ND
Palustric acid	mg/l	ND	ND	ND	ND

Recent reviews of biochemical responses of fish in mesocosms, found that many effluents actually inhibited MFO activity (Mixed Function Oxidase, a measurement of liver enzymes), as well as activity of conjugating enzymes, at concentrations as low 0.25 mg/l, likely due to the presence of fatty and resin acids and chlorophenols. The inhibition of enzyme responses could raise the possibility that comparisons of responses to technology may be confounded by “false negatives” due to toxicity of effluent components. Despite a large number of studies involving effluents from mills using many different bleaching sequences, there is no strong evidence that bleaching was the source of toxic components in final effluent.

Resin and fatty acids are considered intermediate molecular weight compounds with extreme water insolubility properties, which means that they will preferentially be found in suspended solids and/or in sediments. Some of the resin and fatty acids present in effluent at Point A are reduced in concentration at Point C indicating removal through the BHETF treatment system. There are a significant number of resin and fatty acids that are not present in the incoming effluent at Point A, but are present in the final effluent at Point C. Resin and fatty acids are compounds found in wood and would be expected in untreated effluent, albeit in quantities close to detection limits.

1.3.5 Polyaromatic Hydrocarbons (PAHs) and Volatile Organics (VOCs)

Table 1-7 and Table 1-8, below, show the comparative results of the analysis of raw water, untreated effluent from Point A, treated effluent from Point C and water from Caribou Harbour for a comprehensive suite of polyaromatic hydrocarbons and volatile organics.

Table 1-7: Analytical Results, Polyaromatic Hydrocarbons

Polyaromatic Hydrocarbons	Units	Raw water	Point A	Point C	Caribou Harbour

1.3.5.1 Polyaromatic Hydrocarbons

Polyaromatic hydrocarbons (PAH) are composed of multiple aromatic rings (organic rings in which the electrons are delocalized). The simplest such chemicals are naphthalene, having two aromatic rings, and the three-ring compounds anthracene and phenanthrene. PAHs are uncharged, non-polar molecules found in coal and in tar deposits. They are also produced by the thermal decomposition of organic matter (for example, products of combustion in engines and incinerators or forest fires).

The greater majority of all polyaromatic hydrocarbons tested were not detected in any of the samples, as presented in Table 1-7. Two compounds, however, were detected in the effluent: fluoranthene and phenanthrene.

Fluoranthene, which was detected only in the treated effluent at Point C, is typically found in many combustion products, along with other PAHs. Its presence is usually an indicator of less efficient or lower-temperature combustion. Its detection only at Point C, not at Point A, would indicate that release to the environment is likely caused by an external factor, such as the treatment of Boat Harbour Landfill leachate in the current ASB. Implementation of the new ETF should eliminate the presence of this compound from the final effluent. Confirmation, through future testing, will be needed to confirm that it is non-detect in future effluent.

Phenanthrene is a polycyclic aromatic hydrocarbon composed of three fused benzene rings which takes its name from the two terms 'phenyl' and 'anthracene.' It has a role as an environmental contaminant and is naturally present as a metabolic by-product in certain rodents. It is an ortho-fused polycyclic arene, an ortho-fused tricyclic hydrocarbon and is also an indicator of less efficient or lower-temperature combustion and is typically one of the components of cigarette smoke. Its detection at Point C and Point A are in a similar range.

1.3.5.2 Volatile Organics

The health impact of volatile organics (VOCs) is felt mainly by their release to atmosphere, as they are extremely biodegradable. Short-term exposure to high levels of some VOCs have been known to cause breathing problems, headaches, irritation of the eyes, nose and throat. Some people may be more sensitive to VOC's, such as people with asthma.

Most people are not affected by short-term exposure to the low levels of VOCs typically found in homes and automobiles. For long-term exposure to low levels of VOCs, research is ongoing to better understand any health effects from these exposures. Long-term exposure to high levels of some VOCs, however, may result in health effects. For example, in industrial workers, exposure to high levels of some VOCs such as benzene and formaldehyde, has been linked with increased cancer rates.

The only volatile organic compound detected in the various samples tested has been chloroform, which is an extremely volatile but, as shown in Table 1-8 is a readily biodegradable compound generated during the bleaching of pulp with hypochlorite, chlorine, or chlorine dioxide. Hypochlorite bleaching (common in some mechanical pulping applications) results in the greatest amount of chloroform generation while chlorine dioxide bleaching, the only chlorine-based chemical used for bleaching at Northern Pulp, results in the least amount of chloroform generation. As chloroform is generated, it partitions to air and to bleach plant effluent (though, some of the chloroform remains with the pulp). Any chloroform found in bleach plant effluent that is not emitted to the air prior to reaching the wastewater treatment plant is volatilized and degraded during secondary treatment. As would be expected, chloroform is not present in the Point C final effluent.

The major effect from acute (short-term) inhalation exposure to chloroform is central nervous system depression. Chronic (long-term) exposure to chloroform by inhalation in humans has resulted in effects on the liver, including hepatitis and jaundice, and central nervous system effects, such as depression and irritability. Chloroform has been shown to be carcinogenic in animals after oral exposure, resulting in an increase in kidney and liver tumors. The US EPA has classified chloroform as a Group B2, probable human carcinogen.

Because of this air/water partitioning phenomenon, the US EPA decided to regulate chloroform in pulp and paper mill effluent at the discharge of the bleach plant⁸. For existing kraft mills, the daily chloroform discharge standard is 6.92 kg/ADt while the monthly standard is 4.14 kg/ADt, all measured on unbleached pulp production. Based on Northern Pulp effluent testing, combined with the effluent flows and production rates at the times of testing, the chloroform content at Northern Pulp was 0.00071 kg/ADt. US mills can be exempt from chloroform testing if their bleach plant operates under specified conditions and testing demonstrates that the results are consistently below the applicable limits. NPNS results are well below the US EPA limits.

Other volatile and chlorinated organics are also regulated by the US EPA along with chloroform. The other regulated compounds, with their respective limits, are shown in Table 1-9, below.

⁸ 40 CFR Part 430

Table 1-9 Regulated Limits of Various Chlorinated Organics by US EPA

Compound	Regulated Limit (Monthly testing)
2,3,7,8-TCDD	Non-detect (10 pg/l <i>detection limit</i>)
2,3,7,8-TCDF	31.9 pg/l
Trichlorosyringol	Non-detect (2.5 µg/l <i>detection limit</i>)
3,4,5-Trichlorocatechol	Non-detect (5.0 µg/l <i>detection limit</i>)
3,4,6-Trichlorocatechol	Non-detect (5.0 µg/l <i>detection limit</i>)
3,4,5-Trichloroguaiacol	Non-detect (2.5 µg/l <i>detection limit</i>)
3,4,6-Trichloroguaiacol	Non-detect (2.5 µg/l <i>detection limit</i>)
4,5,6-Trichloroguaiacol	Non-detect (2.5 µg/l <i>detection limit</i>)
2,4,5-Trichlorophenol	Non-detect (2.5 µg/l <i>detection limit</i>)
2,4,6-Trichlorophenol	Non-detect (2.5 µg/l <i>detection limit</i>)
Tetrachlorocatechol	Non-detect (5.0 µg/l <i>detection limit</i>)
Tetrachloroguaiacol	Non-detect (5.0 µg/l <i>detection limit</i>)
2,3,4,6-Tetrachlorophenol	Non-detect (2.5 µg/l <i>detection limit</i>)
Pentachlorophenol	Non-detect (5.0 µg/l <i>detection limit</i>)

All parameters listed in Table 1-9 have yielded non-detect results for Northern Pulp's effluent.

1.3.6 Petroleum Hydrocarbons and Polychlorinated Biphenyls

1.3.6.1 Petroleum Hydrocarbons

Table 1-10, below, shows the comparative results of the analysis of raw water, untreated effluent from Point A, treated effluent from Point C and water from Caribou Harbour for a comprehensive suite of petroleum hydrocarbons (PAHs).

Table 1-10: Analytical Results, Petroleum Hydrocarbons

Petroleum Hydrocarbons	Units	Raw water	Point A	Point C	Caribou Harbour
Petroleum hydrocarbons measured at Point C but not in Caribou Harbour					
>C10-C16 Hydrocarbons	mg/l	ND	0.26	0.09	ND
>C16-C21 Hydrocarbons	mg/l	ND	0.62	0.12	ND
>C21-<C32 Hydrocarbons	mg/l	ND	1.5	0.24	ND
Modified TPH (Tier1)	mg/l	ND	2.38	0.30	ND
Petroleum hydrocarbons measured at Point A but not at Point C nor in Caribou Harbour					
C6 - C10 (less BTEX)	mg/l	ND	0.12	ND	ND
Polyaromatic hydrocarbons not detected					
Benzene	mg/l	ND	ND	ND	ND
Toluene	mg/l	ND	ND	ND	ND
Ethylbenzene	mg/l	ND	ND	ND	ND
Total Xylenes	mg/l	ND	ND	ND	ND

Testing for petroleum hydrocarbons in pulp and paper mill effluents can be misleading at times, as the presence of wood extractives in the effluent sample can cause a large bias in the results, making it appear that there are petroleum hydrocarbons present in the samples when there are not. Several precautions and laboratory procedures must be undertaken to help alleviate the bias and ensure test results obtained are a more accurate representation of the levels of petroleum hydrocarbons present in the effluent.

A survey of bioaccumulation studies carried out by ECCC⁹ has shown that bio-concentration of petroleum hydrocarbons could occur after short exposure times but that the majority of organisms also exhibit rapid depuration once the contaminant is removed. None of the studies carried out by ECCC showed any significant measured or modelled bioaccumulation of petroleum hydrocarbons in fish and clams. The installation of the spill basin, along with detailed diversion and isolation procedures in case of a spill at the mill are mitigation measures to reduce the environmental risk from petroleum hydrocarbon spills.

⁹ <http://www.ec.gc.ca/ese-ees/default.asp?lang=En&n=7BF1F2C0-1#toc15>

1.3.6.2 Polychlorinated Biphenyls

Analytical results for the following polychlorinated biphenyls (PCBs) showed non-detectable levels, at the same detection limit (0.05 µg/l) for all samples tested including Middle River, Point A effluent, Point C effluent and Caribou Harbour. All test results are based on 2019 data sets only:

- Aroclor 1016;
- Aroclor 1221;
- Aroclor 1232;
- Aroclor 1248;
- Aroclor 1242;
- Aroclor 1254; and
- Aroclor 1260

1.3.7 Dioxins and Furans

Polychlorinated dibenzo-p-dioxins (PCDDs) and polychlorinated dibenzofurans (PCDFs), commonly known as dioxins and furans, are toxic chemicals found in very small amounts in the environment, including air, water and soil. As a result of their presence in the environment, they are also present in some foods. They have largely been created by human activity, to a great extent as the result of burning plastics, with the biggest sources in Canada coming from the burning of municipal and medical waste. Other major sources include⁷:

- The production of iron and steel;
- Backyard burning of household waste, especially plastics;
- Fuel burning, including diesel fuel and fuel for agricultural purposes and home heating;
- Wood burning, especially if the wood has been chemically treated;
- Electrical power generation; and
- Tobacco smoke.

Dioxins can also be produced from natural processes, such as forest fires and volcanic eruptions. Most dioxins are introduced to the environment through the air. The airborne chemical can attach to small particles that can travel long distances in the atmosphere, which means that Canadians may also be exposed to dioxins and furans created in other countries.

There are 210 different dioxins and furans. All dioxins have the same basic chemical "skeleton," and they all have chlorine atoms as part of their make-up. Furans are similar, but have a different "skeleton". These substances vary widely in toxicity. The one considered most toxic is referred to as 2,3,7,8-tetrachlorodibenzo-p-dioxin, or simply TCDD¹⁰.

Table 1-11, below, shows the analytical results for dioxin and furan testing carried out on the various samples, expressed in toxic equivalents, as defined by the World Health Organization (WHO). All test results are based on 2019 data sets only. A Toxic equivalency factor (TEF) expresses the toxicity of dioxins, furans and PCBs in terms of the most toxic form of dioxin, 2,3,7,8-TCDD¹¹. The toxicity of the individual congeners may vary by orders of magnitude. With the TEFs, the toxicity of a mixture of dioxins and dioxin-like compounds can be expressed in a single number – the toxic equivalency (TEQ). It is a single figure resulting from the product of the concentration and individual TEF values of each congener. The TEF/TEQ concept has been developed to facilitate risk assessment and regulatory control.

The laboratory testing for all dioxin congeners was carried out using gas chromatography with mass spectrometry detection. In this test method, samples are extracted, cleaned, and concentrated, extracts are analyzed using high resolution gas chromatography / high resolution mass spectrometry (HRGC/HRMS). An individual CDD/CDF is identified by comparing the gas chromatograph retention time and ion abundance ratio of two exact mass to charge (m/z) ratios with the corresponding retention time of an authentic standard and the theoretical or acquired ion-abundance ratio of the two exact m/z's. Quantitative analysis is performed using selected ion current profile (SICP) areas.

Laboratory testing was carried out for all dioxin congeners. The presence of any dioxin and furans congeners in the samples analyzed would indicate that, despite the non-detect analytical results for most congeners, other dioxin congeners could be present in the samples: in such a circumstance, the full detection limit is used to quantify the results. The calculated values are presented in Table 1-12, below.

¹² Chlorodibenzodioxin

¹³ Chlorodibenzofuran

Table 1-12: Analytical Results, Dioxins and Furans (with detection limit adjustments)

TOTAL TOXIC EQUIVALENCY	1.00	pg/l	3.282	4.094	3.675	3.213

The results shown above indicate that the total toxic equivalency (TEQ) at Point C is in line with the TEQ of raw water or Caribou Harbour samples. The results demonstrate the effectiveness of the *Pulp and Paper Effluent Regulations* in achieving the virtual elimination of dioxins and furans in pulp and paper mill effluents including NPNS.

¹⁴ Point C data is the averaged data from regulatory test data that is required under the Pulp and Paper Effluent Regulations

¹⁵ Chlorodibenzodioxin

¹⁶ Chlorodibenzofuran

1.4 CONCLUSIONS

A chemical analysis of the raw water, the untreated and treated effluent as well as the sea water at the proposed discharge point was carried out to try to identify the source and contribution of various streams to mill-related loading in the Northumberland Strait. The purpose of this screening was also to establish whether the effluent characteristics found at Point C were representative of the future effluent characteristics with the new ETF and to identify compounds that could warrant further scrutiny within the impact assessment framework that is ongoing at the mill.

A comparison of the untreated and treated effluent components against published effluent composition data showed that the mill's effluent shows no appreciable difference from effluent characteristics from other bleached kraft mills. An analysis of the current system's performance outlined further in Section 2.4 shows that it provides effective treatment and is comparable, performance-wise, to other mills in Canada and elsewhere. Based on its design criteria, the future ETF would also be expected to provide performance that is comparable to other mills in Canada and elsewhere. It is therefore quite reasonable, since current and future systems have comparable performance that Point C can be used as an accurate representation of what the effluent from the new ETF will resemble.

The analysis does show that some components of the Point C effluent, such as mercury and some polyaromatic hydrocarbons appear to come from sources other than Northern Pulp's effluent: these compounds are readily identifiable and, as such, can be considered in that context.

The analysis shows that because of their potential impact on the receiving waters and despite no direct indication that these effects have been observed in the environment, some compounds should be considered for further scrutiny, either as part of future testing or as part of more long-term investigations, such as the Environmental Effects Monitoring (EEM) program or Human Health Risk Assessment (HHRA). These compounds are:

- Routine testing, following established testing frequency protocols and exemptions included in the US pulp and paper regulatory framework:
 - ▶ Chloroform;
 - ▶ Dioxins and furans;
 - ▶ Trichlorosyringol;
 - ▶ 3,4,5-Trichlorocatechol;
 - ▶ 3,4,6-Trichlorocatechol;
 - ▶ 3,4,5-Trichloroguaiacol;
 - ▶ 3,4,6-Trichloroguaiacol;
 - ▶ 4,5,6-Trichloroguaiacol;
 - ▶ 2,4,5-Trichlorophenol;
 - ▶ 2,4,6-Trichlorophenol;
 - ▶ Tetrachlorocatechol;
 - ▶ Tetrachloroguaiacol;
 - ▶ 2,3,4,6-Tetrachlorophenol;
 - ▶ Pentachlorophenol

Longer term impact assessment:

- ▶ o-cresol'
- ▶ p-cresol;
- ▶ m-cresol;
- ▶ Guaiacol;
- ▶ Catechol;
- ▶ 6-chlorovanillin; and
- ▶ 5,6,dichlorovanillin.

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) The APHA Standard Method require pH to be analyzed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the APHA Standard Method holding time.

(2) TOC / DOC present in the sample should be considered as non-purgeable TOC / DOC.

MAC, AO: Guideline - Summary of Guidelines for Canadian Drinking Water Quality (SGCDWQ), Health Canada, Feb. 2017

MAC= Maximum Acceptable Concentration (MAC) - established for substances that are known or suspected to cause adverse effects on health.

AO= Aesthetic Objectives (AO) - apply to characteristics of drinking water that can affect its acceptance by consumers or interfere with practices for supplying good quality water.

Note 1 Turbidity guideline value of 0.3 NTU based on conventional treatment system. For slow sand or diatomaceous earth filtration 1.0 NTU and for membrane filtration 0.1 NTU.
Note 2 Aluminum guideline value of 0.1 mg/L is for treatment plants using aluminum-based coagulants, 0.2mg/L applies to other types of treatment systems.

ND = Not detected
N/A = Not Applicable

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	6.0°C
Package 2	3.0°C
Package 3	2.7°C
Package 4	5.3°C
Package 5	4.0°C

Results relate only to the items tested.

5513173	ZZH	RPD	Total Chemical Oxygen Demand	2018/05/03	NC		%	25
<p>N/A = Not Applicable</p> <p>Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.</p> <p>Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.</p> <p>QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.</p> <p>Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.</p> <p>Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.</p> <p>Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.</p> <p>NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)</p> <p>NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).</p> <p>(1) Poor duplicate results due to sample matrix, results confirmed by repeat analysis.</p> <p>(2) Elevated reporting limit due to sample matrix.</p>								

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Jason Wang, Bedford Micro

Kevin MacDonald, Inorganics Supervisor

Rosemarie MacDonald, Scientific Specialist (Organics)

Maxxam has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B9C9662

Received: 2019/05/15, 13:12

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

- (1) This test was performed by Bureau Veritas Laboratories Mississauga
- (2) This test was performed by Bedford to Edm Petrol Offsite
- (3) This test was performed by Bedford to Calgary Offsite
- (4) This test was performed by Bedford to Burnaby - Offsite
- (5) This test was performed by Bedford to Montreal Subcontract
- (6) Confirmatory runs for 2,3,7,8-TCDF are performed only if the primary result is greater than the RDL.
- (7) TOC / DOC present in the sample should be considered as non-purgeable TOC / DOC.
- (8) The APHA Standard Method require pH to be analyzed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the APHA Standard Method holding time.
- (9) Non-accredited test method

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

- (1) Matrix Spike exceeds acceptance limits, probable matrix interference.
- (2) Elevated reporting limit due to turbidity.
- (3) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.
- (4) EMPC / NDR - Peak detected does not meet ratio criteria and has resulted in an elevated detection limit.

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Brad Newman, Scientific Service Specialist

David Huang, BBY Scientific Specialist

Harry (Peng) Liang, Senior Analyst

Veronica Falk, B.Sc., P.Chem., QP, Scientific Specialist, Organics

Gayle Simpson, Senior Analyst

Eric Dearman, Scientific Specialist

Mike MacGillivray, Scientific Specialist (Inorganics)

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

Note: RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

Note: All parameters included in the present certificate are accredited by the MELCC unless stated otherwise.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	1.7°C
-----------	-------

PHENOLS BY GCMS (WATER)

Un-rounded results are used in the total Regl. P&P Phenols calculation. This total result is then rounded to two significant figures.

The total indicated is calculated only for the requested parameters.

Results relate only to the items tested.

<p>Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.</p> <p>Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.</p> <p>Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.</p>								

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

A handwritten signature in black ink is positioned to the left of a circular stamp. The stamp contains the name 'Maria Dragna Apopei' and the word 'Chimiste' at the top and bottom.

Maria Dragna Apopei, B.Sc., Chemist

Maxxam has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B9C9866

Received: 2019/05/15, 12:49

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

- (1) This test was performed by Bureau Veritas Laboratories Mississauga
- (2) This test was performed by Bedford to Edm Petrol Offsite
- (3) This test was performed by Bedford to Calgary Offsite
- (4) This test was performed by Bedford to Burnaby - Offsite
- (5) This test was performed by Bedford to Montreal Subcontract
- (6) Confirmatory runs for 2,3,7,8-TCDF are performed only if the primary result is greater than the RDL.
- (7) TOC / DOC present in the sample should be considered as non-purgeable TOC / DOC.
- (8) The APHA Standard Method require pH to be analyzed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the APHA Standard Method holding time.
- (9) Non-accredited test method

EDL = Estimated Detection Limit
RDL = Reportable Detection Limit
TEF = Toxic Equivalency Factor, TEQ = Toxic Equivalency Quotient.
The Total Toxic Equivalency (TEQ) value reported is the sum of Toxic Equivalent Quotients for the congeners tested.
WHO(2005): The 2005 World Health Organization, Human and Mammalian Toxic Equivalency Factors for Dioxins and Dioxin-like Compounds
QC Batch = Quality Control Batch
* CDD = Chloro Dibenzo-p-Dioxin
ND = Not detected
N/A = Not Applicable
** CDF = Chloro Dibenzo-p-Furan
(1) EMPC / NDR - Peak detected does not meet ratio criteria and has resulted in an elevated detection limit.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Elevated reporting limit due to turbidity.

(2) Due to a high concentration of NOx, the sample required dilution. The detection limit was adjusted accordingly.

(3) Elevated reporting limit due to method blank performance.

(4) Poor spike recovery due to sample matrix.

Remarks:
Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

BV Labs - Partial/Rush Results

BV Labs Job #: B9C9866
Report Date: 2019/06/06

Northern Pulp N.S.
Client Project #: Effluent Treatment Plant
Site Location: POINT A, EFFLUENT SAMPLING
Your P.O. #: 43013552

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Rosemarie MacDonald, Scientific Specialist (Organics)

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

Note: RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

Note: All parameters included in the present certificate are accredited by the MELCC unless stated otherwise.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	2.7°C
-----------	-------

PHENOLS BY GCMS (WATER)

Un-rounded results are used in the total Regl. P&P Phenols calculation. This total result is then rounded to two significant figures.

The total indicated is calculated only for the requested parameters.

Reported detection limits are multiplied by dilution factors used for sample analysis.

Due to the sample matrix, a better detection limit cannot be reported.

Results relate only to the items tested.

CERTIFICATE OF ANALYSIS – PARTIAL RESULTS

BV LABS JOB #: B9C9866
Received: 2019/05/15, 12:49

Sample Matrix: Water
Samples Received: 1

Analyses	Quantity	Date Extracted	Date Analyzed	Laboratory Method	Reference
Chlorate and Chlorite by IC (1)	1	N/A	2019/05/19	CAL SOP-00040	SM 22-4110D m

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	8.3°C
-----------	-------

Results relate only to the items tested.

BV Labs - Partial/Brush Results

QUALITY ASSURANCE REPORT

QA/QC Batch	Init	QC Type	Parameter	Date Analyzed	Value	Recovery	UNITS	QC Limits
6154325	KD9	Matrix Spike	Dissolved Chlorate (ClO3-)	2019/05/23		NC	%	80 - 120
			Dissolved Chlorite (ClO2-)	2019/05/23		NC	%	80 - 120
6154325	KD9	Spiked Blank	Dissolved Chlorate (ClO3-)	2019/05/19		94	%	80 - 120
			Dissolved Chlorite (ClO2-)	2019/05/19		92	%	80 - 120
6154325	KD9	Method Blank	Dissolved Chlorate (ClO3-)	2019/05/19	ND, RDL=0.10		mg/L	
			Dissolved Chlorite (ClO2-)	2019/05/19	ND, RDL=0.10		mg/L	
6154325	KD9	RPD	Dissolved Chlorate (ClO3-)	2019/05/23	6.7		%	20
			Dissolved Chlorite (ClO2-)	2019/05/23	NC		%	20

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All

Your P.O. #: 43013552
Your Project #: Extra Effluent Testing
Site Location: POINT A, EFFLUENT SAMPLING
Your C.O.C. #: 663334-01-01

Report Date: 2018/06/14
Report #: R5237724
Version: 1 - Final

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B8C8596

Received: 2018/05/30, 13:20

data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

- (1) This test was performed by Maxxam Analytics Mississauga
- (2) This test was performed by Bedford to Edm Petrol Offsite
- (3) This test was performed by Bedford to Calgary Offsite
- (4) This test was performed by Bedford to Calgary Subcontract
- (5) Strong acid dissociable cyanide value may include contribution from thiocyanate.
- (6) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following "Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003". Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.
- (7) The APHA Standard Method require pH to be analyzed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the APHA Standard Method holding time.
- (8) TOC / DOC present in the sample should be considered as non-purgeable TOC / DOC.
- (9) Note: TPH (Heavy Oil) is equivalent to Mineral / Synthetic Oil & Grease.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt:

Package 1	14.3°C
-----------	--------

Note: Average temperature upon receipt greater than 10 degrees.

Sample GVA104 [Point A] : Total Residual Chlorine: sample contained headspace.

ABN analysis: Due to the nature of the sample matrix, a smaller than usual portion of the sample was used for extraction. Detection limits were adjusted accordingly.

CPH Analysis: Due to sample matrix, a smaller than usual portion of the sample was used. Detection limits were adjusted accordingly.

Results relate only to the items tested.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Elevated VOC RDL(s) due to matrix interference.

(2) The recovery was below the lower control limit. This may represent a low bias in some results for flagged analytes.

(3) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

(4) The recovery was above the upper control limit. This may represent a high bias in some results for this specific analyte. For results that were not detected (ND), this potential bias has no impact.

(5) Surrogate recovery was below the lower control limit due to matrix interference. This may represent a lower bias in some results.

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Alan Stewart, Organics Manager, Bedford

Brad Newman, Scientific Service Specialist

Dennis Ngandu, B.Sc., P.Chem., QP, Supervisor, Organics

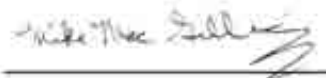

Gayle Simpson, Senior Analyst

Eric Dearman, Scientific Specialist

Jason Wang, Bedford Micro

Mike MacGillivray, Scientific Specialist (Inorganics)

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

QUALITY ASSURANCE REPORT

MAXXAM ANALYTICS
Client Project #: DB8C8596
Site Location: EXTRA EFFLUENT TESTING

QC Batch	Parameter	Date	Matrix Spike		Spiked Blank		Method Blank		RPD	
			% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits
9010453	Dissolved Sulphite (SO3)	2018/06/02	NC	80 - 120	103	80 - 120	<0.50	mg/L	NC	20

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B9C9847

Received: 2019/05/15, 12:54

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

- (1) This test was performed by Bureau Veritas Laboratories Mississauga
- (2) This test was performed by Bedford to Edm Petrol Offsite
- (3) This test was performed by Bedford to Calgary Offsite
- (4) This test was performed by Bedford to Burnaby - Offsite
- (5) This test was performed by Bedford to Montreal Subcontract
- (6) Confirmatory runs for 2,3,7,8-TCDF are performed only if the primary result is greater than the RDL.
- (7) TOC / DOC present in the sample should be considered as non-purgeable TOC / DOC.
- (8) The APHA Standard Method require pH to be analyzed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the APHA Standard Method holding time.
- (9) Non-accredited test method

C13-OCDD *	%	47							6164383
EDL = Estimated Detection Limit RDL = Reportable Detection Limit TEF = Toxic Equivalency Factor, TEQ = Toxic Equivalency Quotient. The Total Toxic Equivalency (TEQ) value reported is the sum of Toxic Equivalent Quotients for the congeners tested. WHO(2005): The 2005 World Health Organization, Human and Mammalian Toxic Equivalency Factors for Dioxins and Dioxin-like Compounds QC Batch = Quality Control Batch ** CDF = Chloro Dibenzo-p-Furan ND = Not detected N/A = Not Applicable * CDD = Chloro Dibenzo-p-Dioxin									

BV Labs Job #: B9C9847
Report Date: 2019/06/11

Northern Pulp N.S.
Client Project #: Effluent Treatment Plant
Site Location: POINT C, EFFLUENT SAMPLING
Your P.O. #: 43013552

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	3.7°C
-----------	-------

Results relate only to the items tested.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Elevated reporting limit due to turbidity.

(2) Due to a high concentration of NOx, the sample required dilution. The detection limit was adjusted accordingly.

(3) Poor spike recovery due to sample matrix.

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

Note: RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

Note: All parameters included in the present certificate are accredited by the MELCC unless stated otherwise.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	2.7°C
-----------	-------

PHENOLS BY GCMS (WATER)

Un-rounded results are used in the total Regl. P&P Phenols calculation. This total result is then rounded to two significant figures.

The total indicated is calculated only for the requested parameters.

Results relate only to the items tested.

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

QUALITY ASSURANCE REPORT

MAXXAM ANALYTICS
Client Project #: DB8C8821
Site Location: EXTRA EFFLUENT TESTING

QC Batch	Parameter	Date	Matrix Spike		Spiked Blank		Method Blank		RPD	
			% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits
9010453	Dissolved Sulphite (SO3)	2018/06/02	NC	80 - 120	103	80 - 120	<0.50	mg/L	NC	20

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

Note: RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

Note: All parameters included in the present certificate are accredited by the MELCC unless stated otherwise.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	4.0°C
-----------	-------

PHENOLS BY GCMS (WATER)

Un-rounded results are used in the total "Total Phenols (RFPP)" calculation. This total result is then rounded to two significant figures.

The total indicated is calculated only for the requested parameters.

Results relate only to the items tested.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

CERTIFICATE OF ANALYSIS – PARTIAL RESULTS

BV LABS JOB #: 89J7249

Received: 2019/07/17, 12:43

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

- (1) This test was performed by Bureau Veritas Laboratories Mississauga
- (2) This test was performed by Bedford to Edm Petrol Offsite
- (3) This test was performed by Bedford to Calgary Offsite
- (4) This test was performed by Bedford to Montreal Subcontrac
- (5) The APHA Standard Method require pH to be analyzed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the APHA Standard Method holding time.
- (6) Non-accredited test method
- (7) TOC / DOC present in the sample should be considered as non-purgeable TOC / DOC.

BV Labs - Port of Pulp & Paper

QUALITY ASSURANCE REPORT(CONT'D)

QA/QC Batch	Init	QC Type	Parameter	Date Analyzed	Value	Recovery	UNITS	QC Limits
			Sandaracopimaric acid	2019/07/22	1.0		%	30
<p>N/A = Not Applicable</p> <p>Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.</p> <p>Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.</p> <p>QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.</p> <p>Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.</p> <p>Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.</p> <p>Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.</p> <p>NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)</p> <p>NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).</p> <p>(1) BOD Analysis: Reference Material and Second source QC recoveries were high which may indicate a high bias in results.</p> <p>(2) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.</p> <p>(3) VDC sample contained sediment.</p> <p>(4) Elevated PAH RDL(s) due to matrix / co-extractive interference.</p>

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope

dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

- (1) This test was performed by Bureau Veritas Laboratories Mississauga
- (2) This test was performed by Bedford to Calgary Offsite
- (3) This test was performed by Bedford to Burnaby - Offsite
- (4) This test was performed by Bedford to Montreal Subcontrac
- (5) Confirmatory runs for 2,3,7,8-TCDF are performed only if the primary result is greater than the RDL.
- (6) TOC / DOC present in the sample should be considered as non-purgeable TOC / DOC.
- (7) The APHA Standard Method require pH to be analyzed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the APHA Standard Method holding time.
- (8) Non-accredited test method

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	8.7°C
-----------	-------

Sample received past the recommended holding time for BOD testing.

Sample VT5932 [JVR264-04R\CARIBOU SEA WATER 1] : Sample matrix (Sea Water) is not suitable for Adsorbable Organic Halogens analysis and is beyond the scope of the method.

Sample JVR046 [CARIBOU SEA WATER 1] : Elevated reporting limits for trace metals due to sample matrix.

Results relate only to the items tested.

<p>N/A = Not Applicable</p> <p>Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.</p> <p>Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.</p> <p>QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.</p> <p>Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.</p> <p>Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.</p> <p>Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.</p> <p>NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)</p> <p>NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).</p> <p>(1) BOD Analysis: Second source QC recovery high. Reference Material recovery and all other QC acceptable.</p> <p>(2) PAH sample contained sediment.</p> <p>(3) Matrix Spike: results are outside acceptance limit. Probable matrix interference.</p> <p>(4) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.</p> <p>(5) EMPC / NDR - Peak detected does not meet ratio criteria and has resulted in an elevated detection limit.</p>									

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Brad Newman, Scientific Service Specialist

Harry (Peng) Liang, Senior Analyst

Veronica Falk, B.Sc., P.Chem., QP, Scientific Specialist, Organics

Mike MacGillivray, Scientific Specialist (Inorganics)

Owen Cosby, BSc.C.Chem, Supervisor, HRMS Services

Rosemarie MacDonald, Scientific Specialist (Organics)

Rob Reinert, B.Sc., Scientific Specialist

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

Note: RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

Note: All parameters included in the present certificate are accredited by the MELCC unless stated otherwise.

GENERAL COMMENTS

PHENOLS BY GCMS (WATER)

Un-rounded results are used in the total "Total Phenols (RFPP)" calculation. This total result is then rounded to two significant figures.

The total indicated is calculated only for the requested parameters.

Reported detection limits are modified according to the volume of sample received.

Results relate only to the items tested.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope

dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

- (1) This test was performed by Bureau Veritas Laboratories Mississauga
- (2) This test was performed by Bedford to Calgary Offsite
- (3) This test was performed by Bedford to Burnaby - Offsite
- (4) This test was performed by Bedford to Montreal Subcontract
- (5) Confirmatory runs for 2,3,7,8-TCDF are performed only if the primary result is greater than the RDL.
- (6) TOC / DOC present in the sample should be considered as non-purgeable TOC / DOC.
- (7) The APHA Standard Method require pH to be analyzed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the APHA Standard Method holding time.
- (8) Non-accredited test method

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	7.7°C
-----------	-------

Sample: JVR264 [CARIBOU SEA WATER CH-BOF 1-1] : Elevated reporting limits for trace metals due to sample matrix.

Results relate only to the items tested.

			Sandaracopimaric acid	2019/06/01	NC		%	30
<p>N/A = Not Applicable</p> <p>Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.</p> <p>Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.</p> <p>QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.</p> <p>Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.</p> <p>Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.</p> <p>Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.</p> <p>NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)</p> <p>NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).</p> <p>(1) BOD Analysis: Second source QC recovery high. Reference Material recovery and all other QC acceptable.</p> <p>(2) PAH sample contained sediment.</p> <p>(3) Matrix Spike: results are outside acceptance limit. Probable matrix interference.</p> <p>(4) Elevated spike recovery due to sample matrix, result confirmed by repeat analysis.</p> <p>(5) Poor duplicate agreement due to sample inhomogeneity, insufficient sample available to confirm results.</p> <p>(6) Poor spike recovery due to sample matrix, result confirmed by repeat analysis.</p> <p>(7) EMPC / NDR - Peak detected does not meet ratio criteria and has resulted in an elevated detection limit.</p>								

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Brad Newman, Scientific Service Specialist

Harry (Peng) Liang, Senior Analyst

Veronica Falk, B.Sc., P.Chem., QP, Scientific Specialist, Organics

Eric Dearman, Scientific Specialist

Ewa Pranjic, M.Sc., C.Chem, Scientific Specialist

Mike MacGillivray, Scientific Specialist (Inorganics)

Owen Cosby, BSc.C Chem, Supervisor, HRMS Services

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

Note: RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

Note: All parameters included in the present certificate are accredited by the MELCC unless stated otherwise.

Client Project #: B9E4487

GENERAL COMMENTS

PHENOLS BY GCMS (WATER)

Un-rounded results are used in the total "Total Phenols (RFPP)" calculation. This total result is then rounded to two significant figures.

The total indicated is calculated only for the requested parameters.

Reported detection limits are modified according to the volume of sample received.

Results relate only to the items tested.

QUALITY ASSURANCE REPORT

				3,4,5,6-Tetrachloroveratrol	2019/06/04	<0.50		ug/l	
<p>Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.</p> <p>Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.</p> <p>Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.</p>

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Maria Dragna Apopei, B.Sc., Chemist

Lab BV has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005 (E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B9E4914

Received: 2019/05/29, 12:53

dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

- (1) This test was performed by Bureau Veritas Laboratories Mississauga
- (2) This test was performed by Bedford to Calgary Offsite
- (3) This test was performed by Bedford to Burnaby - Offsite
- (4) This test was performed by Bedford to Montreal Subcontract
- (5) This test was performed by Bedford to Lex Subcontract
- (6) TOC / DOC present in the sample should be considered as non-purgeable TOC / DOC.
- (7) The APHA Standard Method require pH to be analyzed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the APHA Standard Method holding time.
- (8) Non-accredited test method

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	6.3°C
-----------	-------

Sample received past the recommended holding time for BOD testing.

Sample JVU441 [CARIBOU SEA WATER CH-BOF 1-2] : Elevated reporting limits for trace metals due to sample matrix.

Results relate only to the items tested.

QUALITY ASSURANCE REPORT(CONT'D)

QA/QC Batch	Init	QC Type	Parameter	Date Analyzed	Value	Recovery	UNITS	QC Limits
			Sandaracopimaric acid	2019/06/01	NC		%	30
<p>N/A = Not Applicable</p> <p>Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.</p> <p>Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.</p> <p>QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.</p> <p>Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.</p> <p>Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.</p> <p>Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.</p> <p>NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)</p> <p>NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).</p> <p>(1) BOD Analysis: Second source QC recovery high. Reference Material recovery and all other QC acceptable.</p> <p>(2) PAH sample contained sediment.</p> <p>(3) Matrix Spike: results are outside acceptance limit. Probable matrix interference.</p> <p>(4) Elevated spike recovery due to sample matrix, result confirmed by repeat analysis.</p> <p>(5) Poor spike recovery due to sample matrix, result confirmed by repeat analysis.</p>								

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Brad Newman, Scientific Service Specialist

Harry (Peng) Liang, Senior Analyst

Veronica Falk, B.Sc., P.Chem., QP, Scientific Specialist, Organics

Eric Dearman, Scientific Specialist

Ewa Pranjic, M.Sc., C.Chem, Scientific Specialist

Rosemarie MacDonald, Scientific Specialist (Organics)

Rob Reinert, B.Sc., Scientific Spécialist

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

Note: RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

Note: All parameters included in the present certificate are accredited by the MELCC unless stated otherwise.

GENERAL COMMENTS

PHENOLS BY GCMS (WATER)

Un-rounded results are used in the total "Total Phenols (RFPP)" calculation. This total result is then rounded to two significant figures.

The total indicated is calculated only for the requested parameters.

Reported detection limits are modified according to the volume of sample received.

Results relate only to the items tested.

<p>Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.</p> <p>Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.</p> <p>Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.</p>

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Maria Dragna Apopei, B.Sc., Chemist

Lab BV has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005 (E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

 Received by (Sign) [Signature] (print) Marie Desrosiers Date and Time 2019/05/31 09:00

NOTES:

- Please call us if due date cannot be met. Please reference Sample ID on your report.
- Please advise us if your laboratory cannot perform the requested analysis or must subcontract to a 3rd party lab
- Include copy of this completed form, Client COC & signed final report to BClientSvcSubContr@maxxam.ca and to MComeau@maxxam.ca

Reporting Requirements:

National: N001
Regional:

31-May-19 09:00
Sophie Retailleau
B920960

Shipping Instructions

- Ship Immediately (highlight Yellow) Ship Cold
 Requires 9am Ship Room Temp
 Requires Sat. Delivery Ship Frozen
 Regular Ship next available day COC Must be Attached
 Sender (Print) Kim [Signature] Initial KC

Shipping Department Checklist

- Correct Shipping location
 Correct Sample Ids (Paperwork vs Bottles)
 Yes No Special-Cooly, Ice, Tape-custody seal, Date&Sign
 Date Shipped May 30/19 Number of coolers _____
 Shipper (Print) _____ Initial [Signature]

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B9E4476

Received: 2019/05/29, 12:45

dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

- (1) This test was performed by Bureau Veritas Laboratories Mississauga
- (2) This test was performed by Bedford to Calgary Offsite
- (3) This test was performed by Bedford to Burnaby - Offsite
- (4) This test was performed by Bedford to Montreal Subcontract
- (5) Confirmatory runs for 2,3,7,8-TCDF are performed only if the primary result is greater than the RDL.
- (6) TOC / DOC present in the sample should be considered as non-purgeable TOC / DOC.
- (7) The APHA Standard Method require pH to be analyzed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the APHA Standard Method holding time.
- (8) Non-accredited test method

EDL = Estimated Detection Limit									
RDL = Reportable Detection Limit									
TEF = Toxic Equivalency Factor, TEQ = Toxic Equivalency Quotient,									
The Total Toxic Equivalency (TEQ) value reported is the sum of Toxic Equivalent Quotients for the congeners tested.									
WHO(2005): The 2005 World Health Organization, Human and Mammalian Toxic Equivalency Factors for Dioxins and Dioxin-like Compounds									
QC Batch = Quality Control Batch									
* CDD = Chloro Dibenzo-p-Dioxin									
ND = Not detected									
N/A = Not Applicable									
** CDF = Chloro Dibenzo-p-Furan

BV Labs Job #: B9E4476
Report Date: 2019/06/24

Northern Pulp N.S.
Client Project #: Effluent Treatment Plant
Your P.O. #: 43013552

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	7.0°C
-----------	-------

Sample received past the recommended holding time for BOD testing.

Sample JVR188 [CARIBOU SEA WATER CHB 2-1] : Elevated reporting limits for trace metals due to sample matrix.

Results relate only to the items tested.

<p>N/A = Not Applicable</p> <p>Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.</p> <p>Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.</p> <p>QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.</p> <p>Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.</p> <p>Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.</p> <p>Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.</p> <p>NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)</p> <p>NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).</p> <p>(1) BOD Analysis: Second source QC recovery high. Reference Material recovery and all other QC acceptable.</p> <p>(2) PAH sample contained sediment.</p> <p>(3) Matrix Spike: results are outside acceptance limit. Probable matrix interference.</p> <p>(4) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.</p> <p>(5) EMPC / NDR - Peak detected does not meet ratio criteria and has resulted in an elevated detection limit.</p>

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

Note: RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

Note: All parameters included in the present certificate are accredited by the MELCC unless stated otherwise.

This report has been generated and distributed using a secure automated process.

Lab BV has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

GENERAL COMMENTS

PHENOLS BY GCMS (WATER)

Un-rounded results are used in the total "Total Phenols (RFPP)" calculation. This total result is then rounded to two significant figures.

The total indicated is calculated only for the requested parameters.

Reported detection limits are modified according to the volume of sample received.

Results relate only to the items tested.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B9E4405

Received: 2019/05/29, 12:45

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

- (1) This test was performed by Bureau Veritas Laboratories Mississauga
- (2) This test was performed by Bedford to Calgary Offsite
- (3) This test was performed by Bedford to Burnaby - Offsite
- (4) This test was performed by Bedford to Montreal Subcontract
- (5) This test was performed by Bedford to Lex Subcontract
- (6) Confirmatory runs for 2,3,7,8-TCDF are performed only if the primary result is greater than the RDL.
- (7) TOC / DOC present in the sample should be considered as non-purgeable TOC / DOC.
- (8) The APHA Standard Method require pH to be analyzed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the APHA Standard Method holding time.
- (9) Non-accredited test method

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	9.0°C
-----------	-------

Sample received past the recommended holding time for BOD testing.

Sample JVQ871 [CARIBOU SEA WATER CH-BOF 2-2] : Elevated reporting limits for trace metals due to sample matrix.

Results relate only to the items tested.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) BOD Analysis: Second source QC recovery high. Reference Material recovery and all other QC acceptable.

(2) PAH sample contained sediment.

(3) Matrix Spike: results are outside acceptance limit. Probable matrix interference.

(4) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

(5) EMPC / NDR - Peak detected does not meet ratio criteria and has resulted in an elevated detection limit.

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Brad Newman, Scientific Service Specialist

Harry (Peng) Liang, Senior Analyst

Veronica Falk, B.Sc., P.Chem., QP, Scientific Specialist, Organics

Eric Dearman, Scientific Specialist

Mike MacGillivray, Scientific Specialist (Inorganics)

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

Note: RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

Note: All parameters included in the present certificate are accredited by the MELCC unless stated otherwise.

GENERAL COMMENTS

PHENOLS BY GCMS (WATER)

Un-rounded results are used in the total "Total Phenols (RFPP)" calculation. This total result is then rounded to two significant figures.

The total indicated is calculated only for the requested parameters.

Reported detection limits are modified according to the volume of sample received.

Results relate only to the items tested.
